

LCCMR Minnesota Statewide Conservation and Preservation Plan

INSTITUTE ON THE
ENVIRONMENT

UNIVERSITY OF MINNESOTA

Biofuel Energy Use Team (Mulla and Fosnacht, co-leads)

- Identify biofuel and energy trends and impacts, including potential trends in energy and fuel conservation
- Map priority natural resource areas affected by these trends
- Identify energy-related investment and policy choices that impact natural resources

Energy production and use: Progress

- Examine 3 overarching energy & environmental policy scenarios relevant to future sustainable energy systems
 - 1. Continuation of current energy & environmental policy & incentives
 - 2. Shift to policies/practices that promote significant conservation of energy and alternative energy sources
 - 3. Scenario 2 + policies/practices that promote significant environmental benefits from land use practices
- For each scenario: identify trends, evaluate biofuel options and impacts, recommend strategies

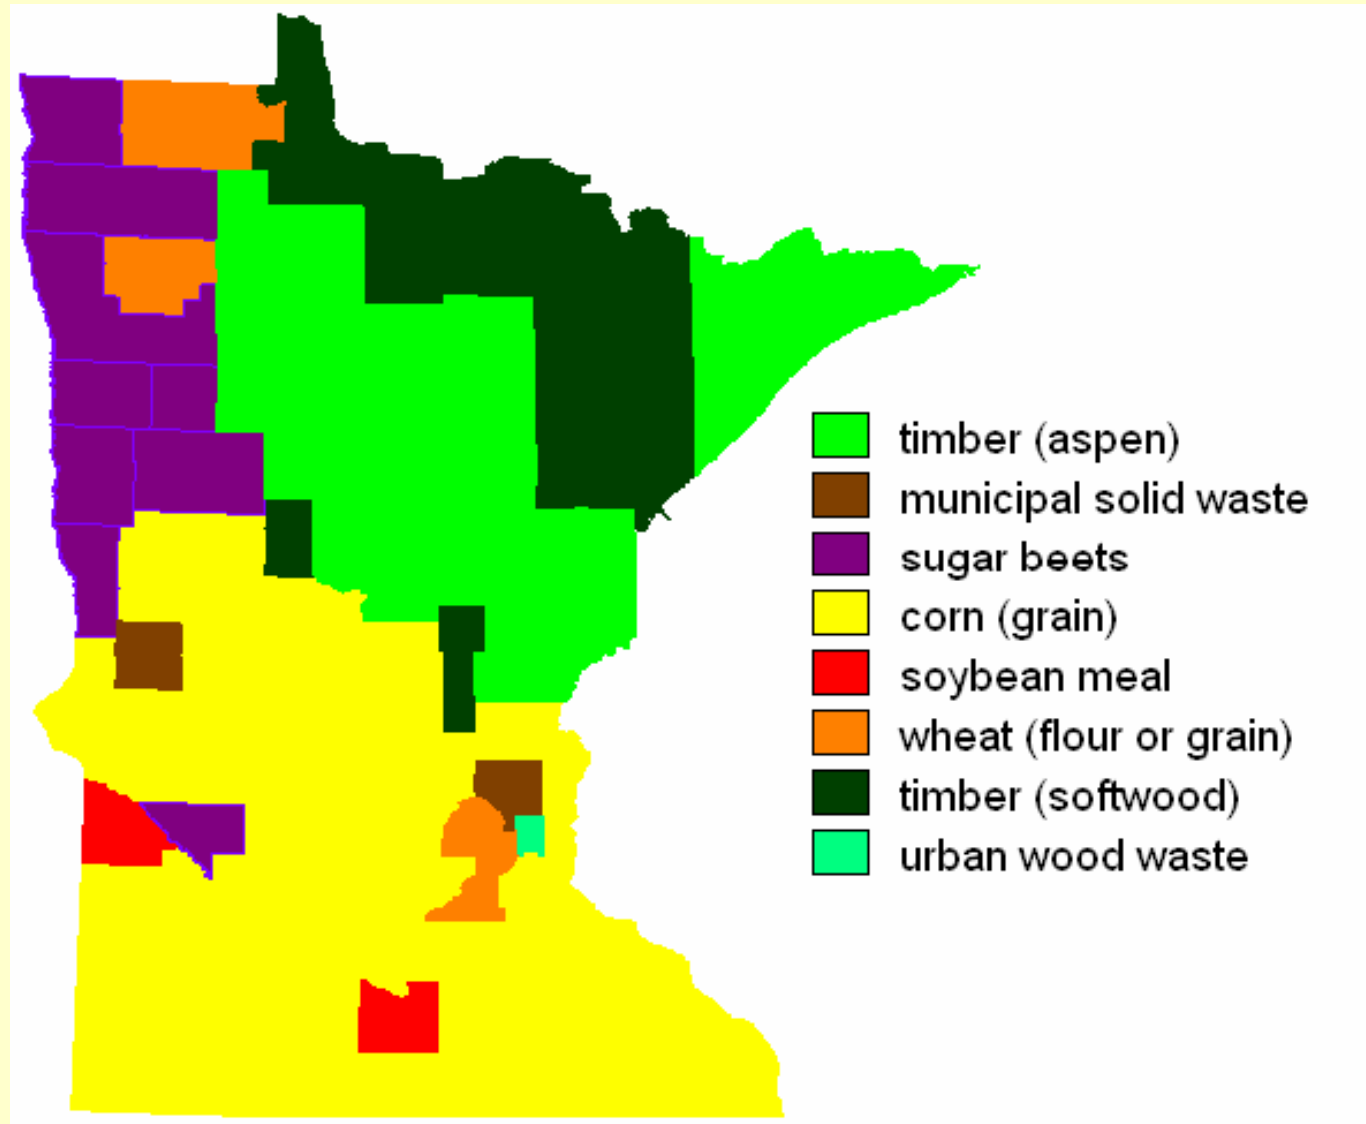

Agricultural Land-use Options

- 3 major options for Ag. Landscapes
 - *Corn-soybean rotation*
 - Probably more corn, collection of corn biomass
 - *Monocultures of perennial energy crops*
 - Switchgrass, miscanthus, hybrid poplar, others
 - *Polycultures of perennial energy crops*
 - Grass-legume mixtures, native prairie plantings
- For each overarching scenario:
 - We will determine expected pattern of options across ag. landscapes
 - We will determine expected environmental impacts and benefits/costs of each pattern
- Ex.: Environmental scenario likely means more perennials

Largest bio-feedstock by county in Minnesota

Example of mapping step:

Species of Greatest
Conservation Need

Species richness by
township

and

Top 10% of townships
within each Ecological
Section

Townships: species richness * private land

Species richness multiplied by private land area.

Townships outlined in white are the 10% of the subsection containing the most species richness.

Private land * species

Date: Jan 7, 2008

Prepared by: Terry Brown, NRRI

LCCMR Minnesota
Statewide
Conservation Plan

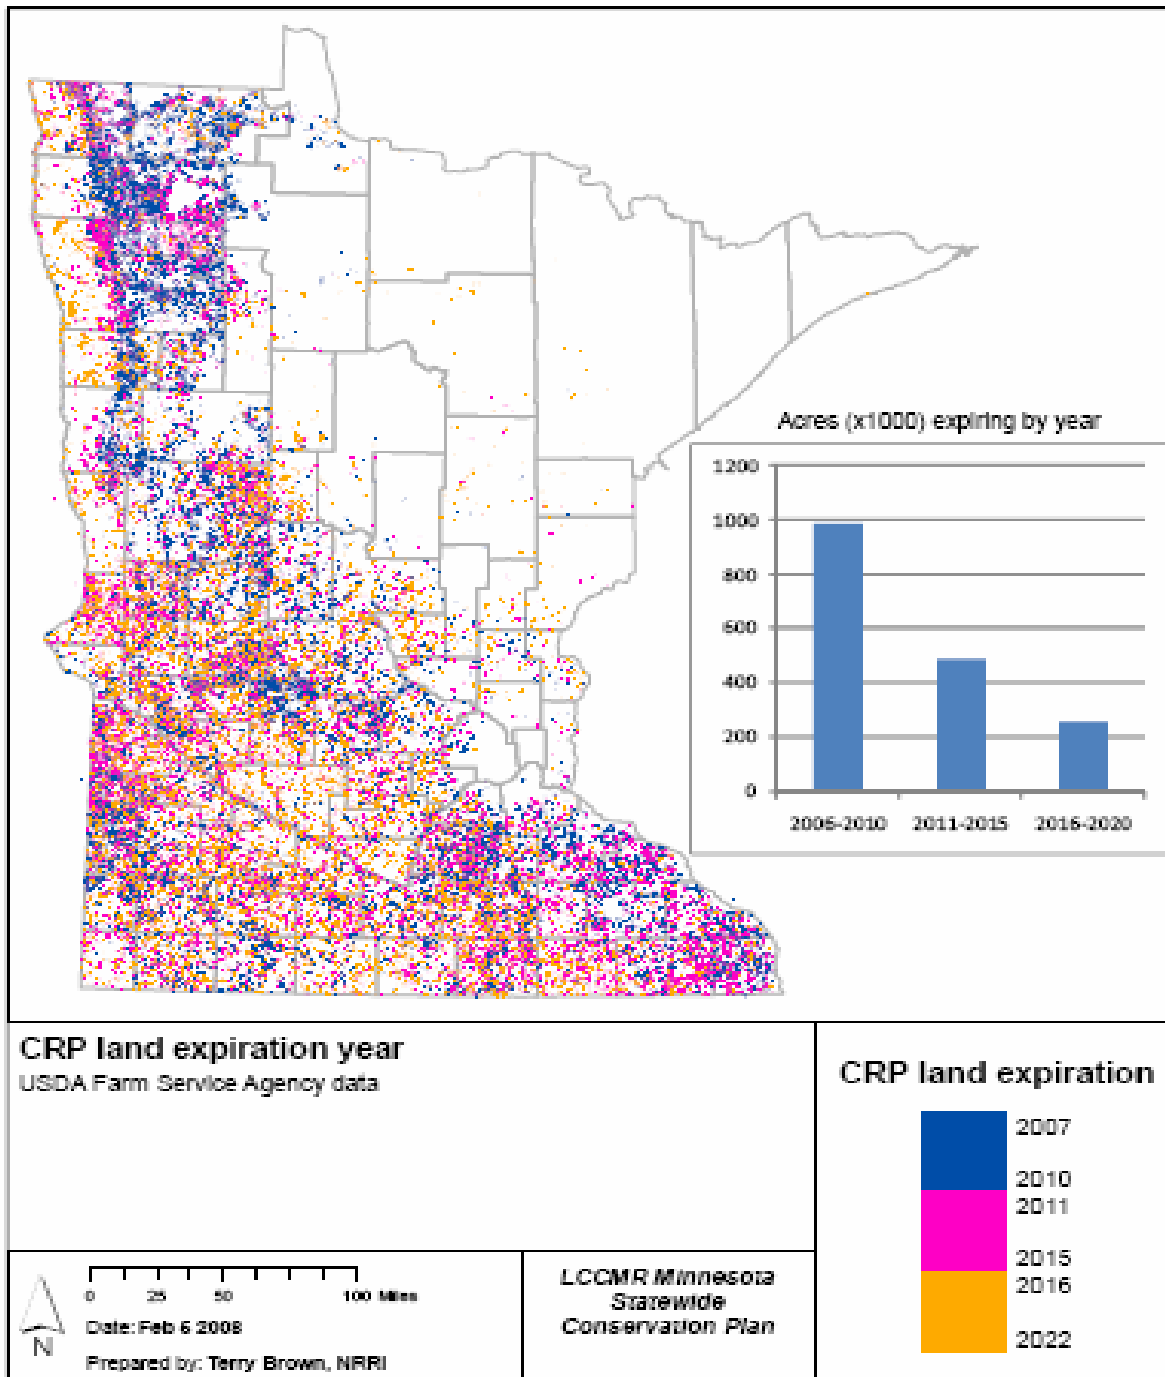

Example of mapping step:

Vulnerable key habitats
 The darkest blue color in each Ecological Subsection shows the townships with the top 10% of vulnerable key habitats for that subsection

<p>Vulnerable key habitat by township Key habitat from crosswalk of GAP data Township ranking relative to subsection</p>	<p>Vulnerable key habitat in township by subsection</p>
<p>Date: Feb 4 2008 Prepared by: Terry Brown, NRR</p>	<p>LCCMR Minnesota Statewide Conservation Plan</p>

Trend Analysis Example:

Conservation
Reserve Program
Year of expiration

acreage

Landscape Decision Matrix for Future Land Use Scenarios

Vulnerability ↑

Suitable for Perennial Biofuel Crops	Suitable for Annual Crops with BMPs or Perennial Biofuel Crops
Suitable for Housing Developments	Suitable for Annual Crops

Productivity →

Water Budget for Corn-Soybean Rotation in Le Sueur River

Component	Water Budget (mm/yr or %)
Precipitation	850 (100%)
Evapotranspiration	569 (67%)
Streamflow	214 (100%)
Tile Drainage	127 (59%)
Surface Runoff	39 (18%)
Shallow Groundwater	41 (19%)
Interflow	3 (1%)
Shallow Recharge	28 (13%)
Deep Recharge	4 (2%)

LCCMR Studies on Ground Water Sustainability (Nieber, Shmagin, Kanivetsky, Mulla, Wilson)

- Minnesota ground water is used for a variety of economic enterprises
- Ground water discharge also feeds many wetlands, streams and rivers in Minnesota
- How does the renewable capacity of ground water vary across the state for both surficial and deep aquifers?
- What are the current and projected demands for ground water consumption?

Minnesota Water Use 2005

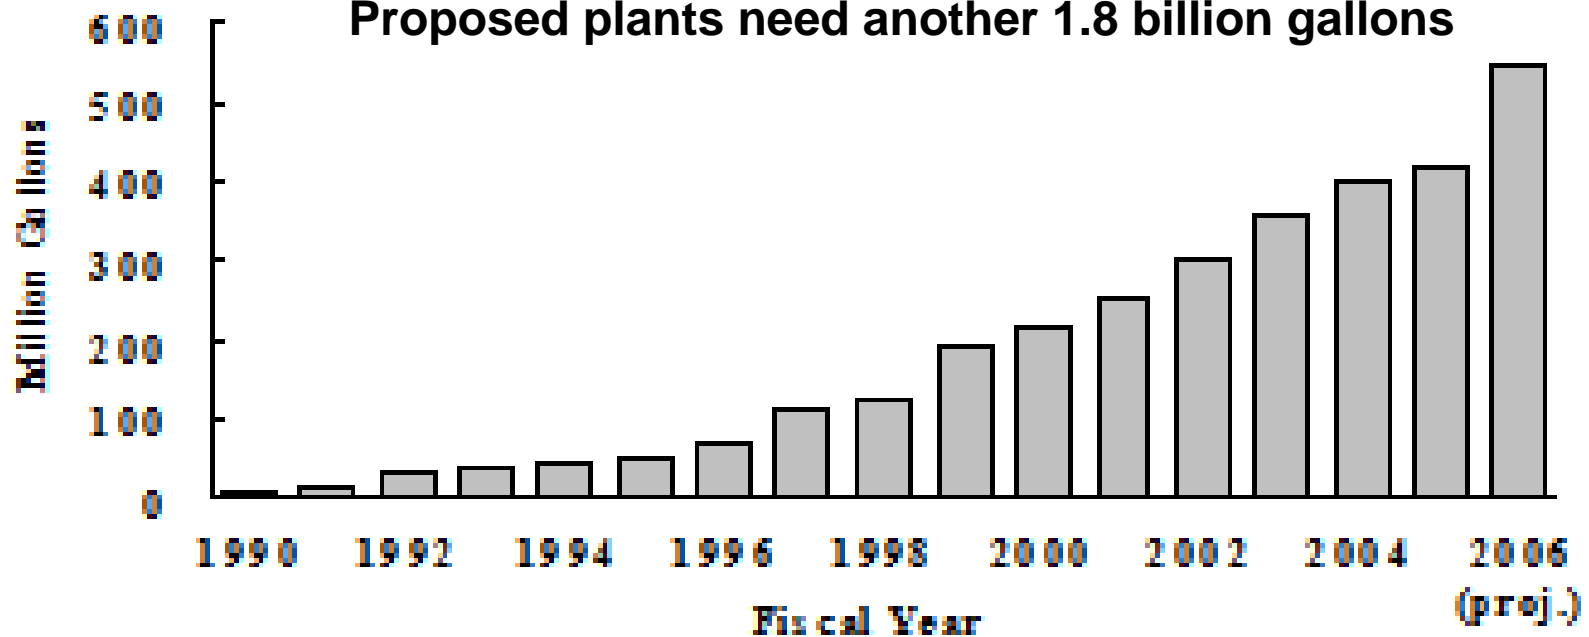

MN DNR Waters

Billions of Gallons

Ethanol Production in Minnesota

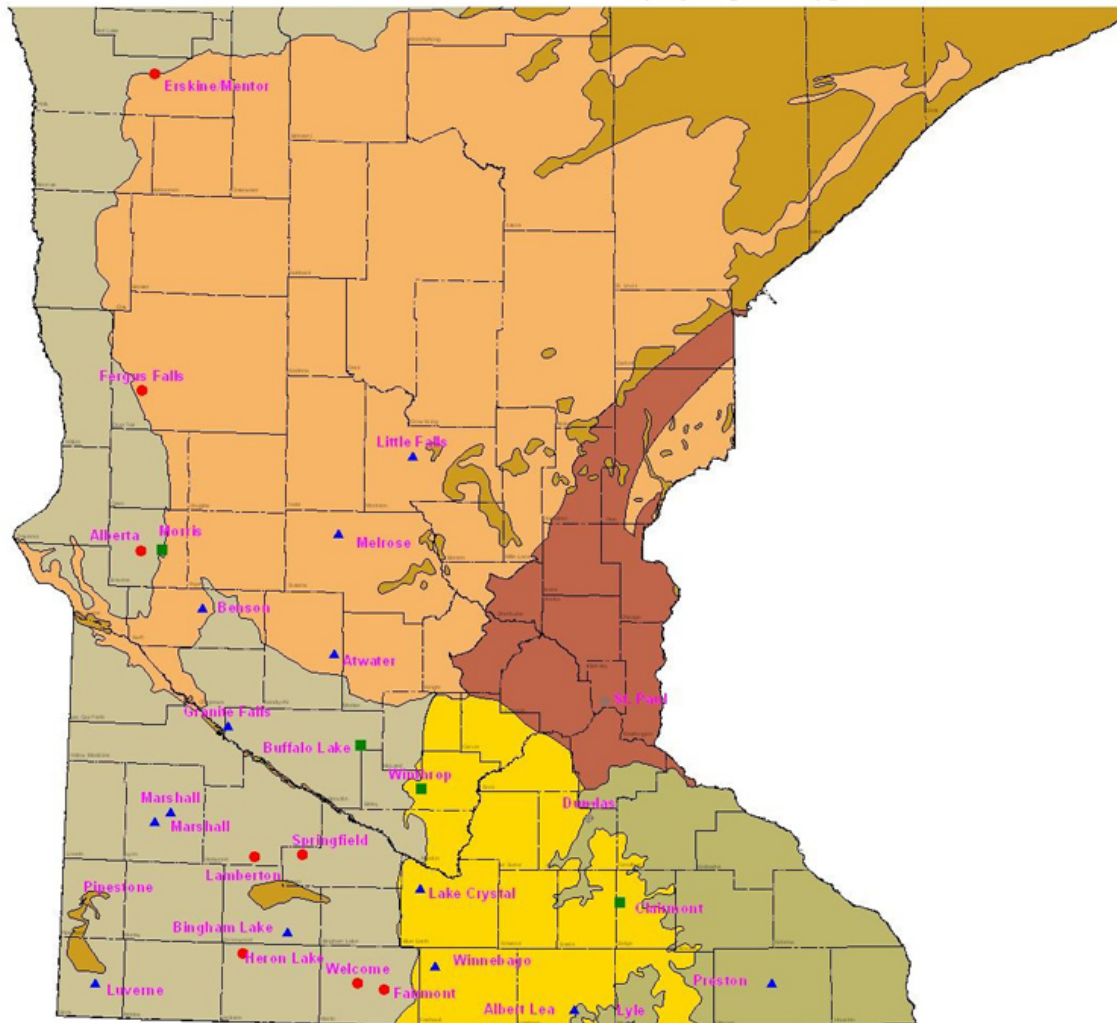

2.4 billion gallons of water needed in 2006

Proposed plants need another 1.8 billion gallons

Minnesota Ethanol Plants & Water Availability by Aquifer Type

Status	Water Availability by Aquifer Type
⊕ closed	Moderate surficial & buried, good bedrock aquifers
× dropped	Limited surficial, moderate buried & good bedrock aquifers
■ expansion pending	Limited surficial & buried, good bedrock aquifers
● pending	Good surficial, moderate buried, limited bedrock aquifers
▲ permitted	Moderate surficial, limited buried & bedrock aquifers
	Limited surficial, buried & bedrock aquifers

LCCMR Aquifer Recharge Study

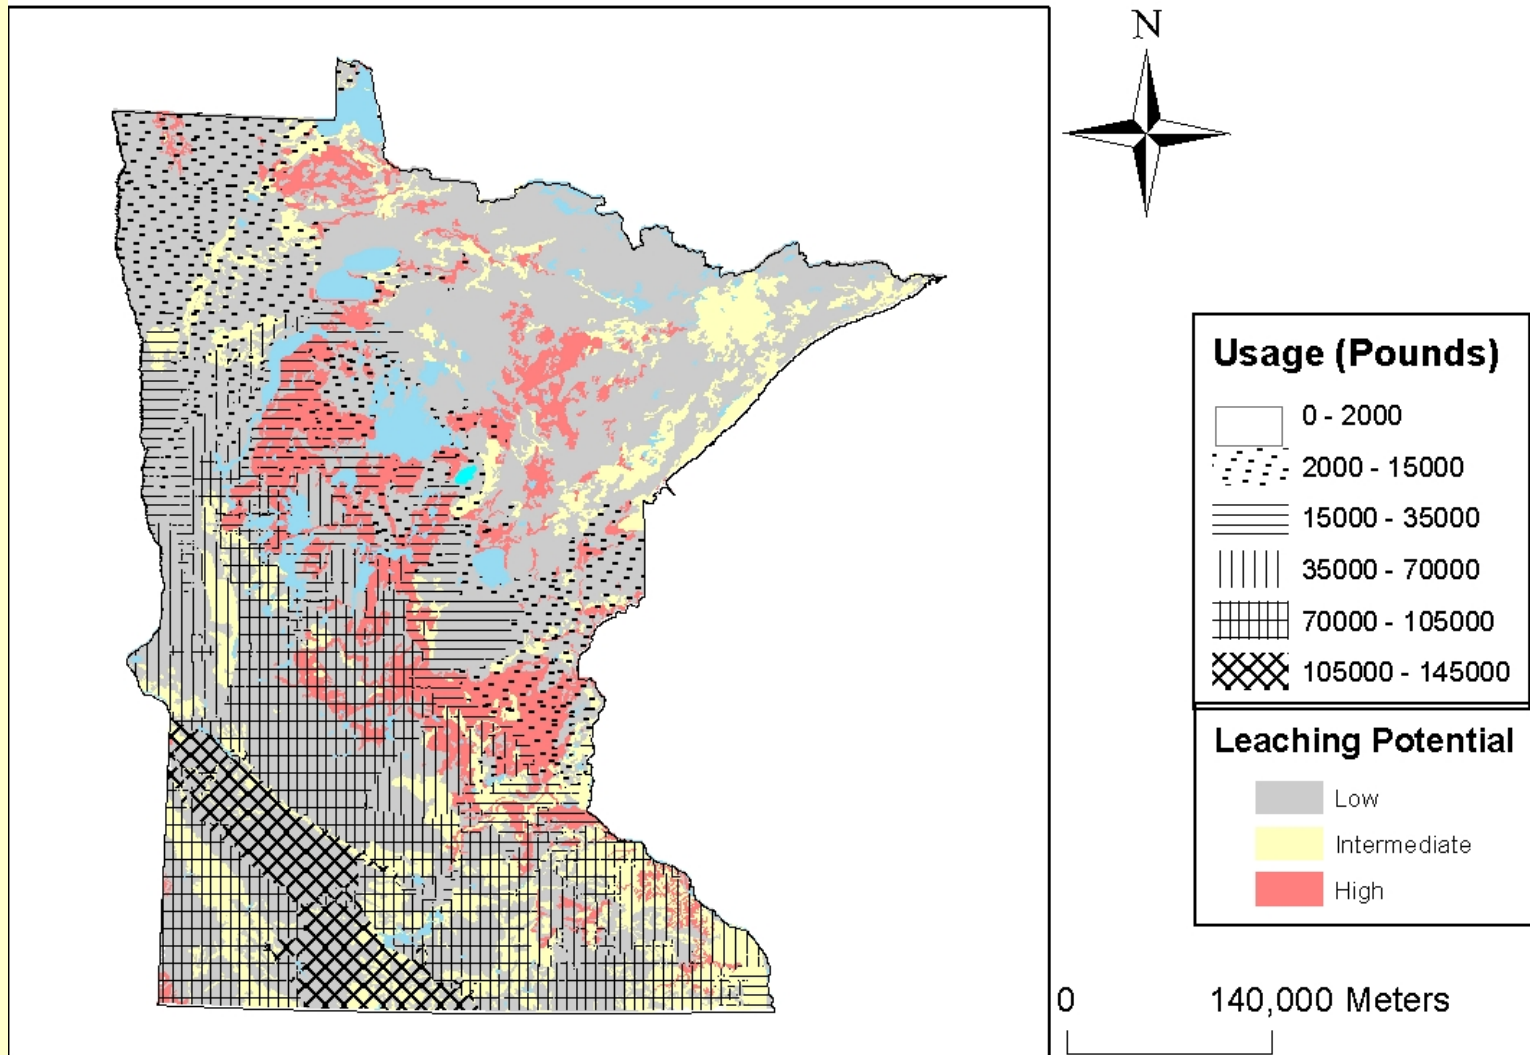

Monthly runoff for *LMF* Laurentian Mixed Forest; *EBF* Eastern Broadleaf Forest; *PP* Prairie Parkland (Shmagin and Kanivetsky, 2002)

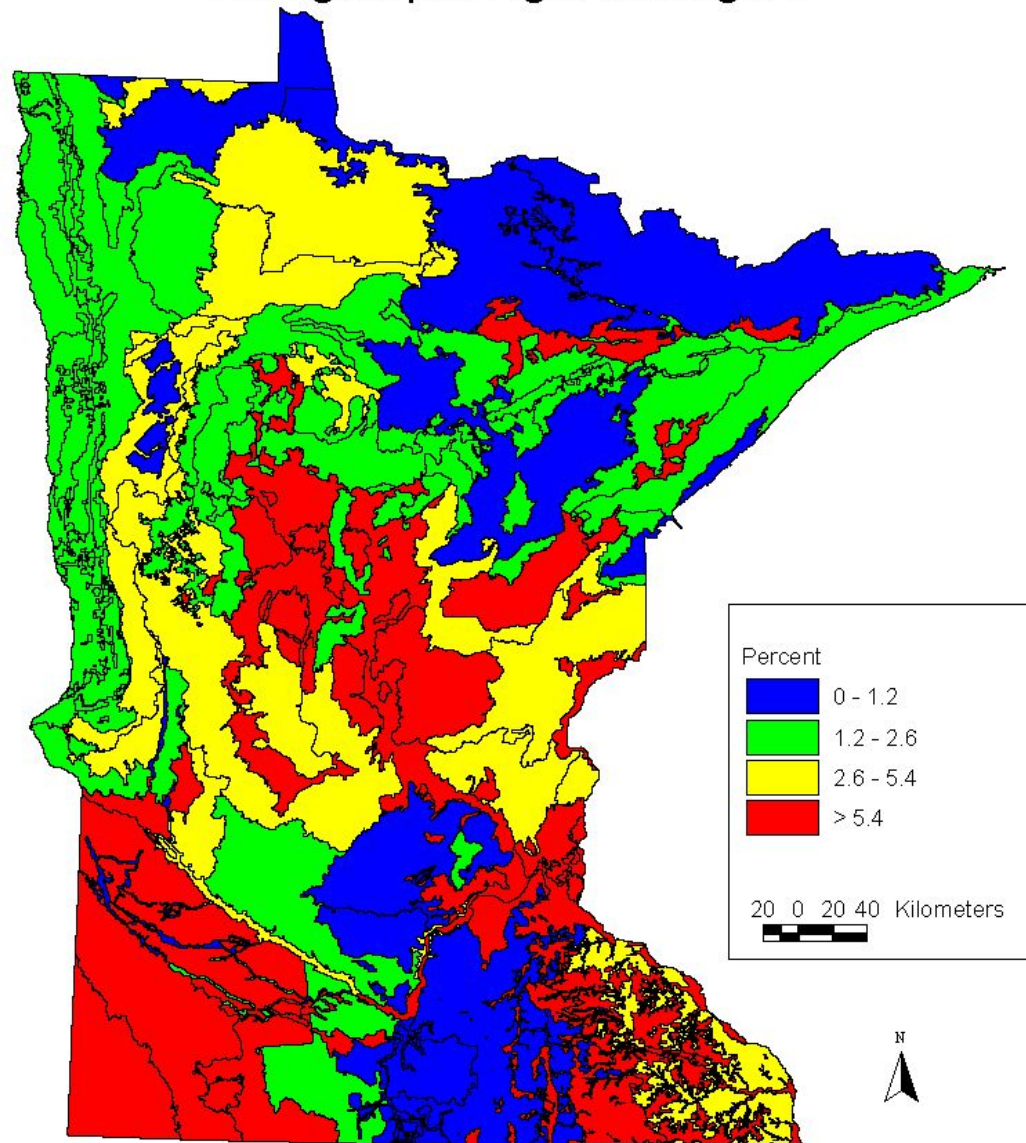

Acetochlor Usage and Predicted Leaching Potential

Proportion of Wells Exceeding 3 mg/L Nitrate-Nitrogen per Agroecoregion

Data Provided by the Minnesota Department of Health Source Water Protection Unit

Conclusions

- Minnesota's land is expected to provide many types of functions
 - Food, fiber and feed
 - Biofuels
 - Alternative energy
- At the same time we expect
 - Clean, sustainable water
 - Rich, diverse fish and wildlife resources
- Balancing these two objectives requires careful planning, wise policy and targeted incentives
